

How Does 3DVAR Work: The Navier-Stokes Equation

Kody Law (University of Warwick), Andrew Stuart, Dirk Bloemker, Kostas Zygalakis

In the perfect model scenario two ideas drive accurate filtering: (i) observe enough low frequency information, and (ii) model variance inflation: trust the observations. In this talk I will illustrate this for 3DVAR applied to the Navier-Stokes equations, in the low and high frequency observation limits.
